

Content of Defragment a Volume.vbs (Site 1)

' Description: Defragments volume D on a computer. If you modify this script to defragment a different volume (such as X), note that your WQL query must specify the drive letter followed by a colon and then follow

```
strComputer = "."
Set objWMIService = GetObject("winmgmts:"
    & "(impersonationLevel=impersonate)!\\" & strComputer & "\root\cimv2")

Set colVolumes = objWMIService.ExecQuery _
    ("Select * from Win32_Volume Where Name = 'D:\\'")

For Each objVolume in colVolumes
    errResult = objVolume.Defrag()
Next
```
