

Content of Read Arguments from an Active Directory Container.vbs (Site 1)

' Description: Demonstration script that retrieves the names of all the computers in an Active Directory container, and then returns service information from each of those computers.

```
Set objDictionary = CreateObject("Scripting.Dictionary")
```

```
i = 0  
Set objOU = GetObject("LDAP://CN=Computers, DC=fabrikam, DC=com")  
objOU.Filter = Array("Computer")
```

```
For Each objComputer in objOU  
    objDictionary.Add i, objComputer.CN  
    i = i + 1  
Next
```

```
For Each objItem in objDictionary  
    Set colServices = GetObject("winmgmts://" & _  
        objDictionary.Item(objItem) & _  
        & "").ExecQuery("Select * from Win32_Service")  
    Wscript.Echo colServices.Count  
Next
```
