

Content of Verify Computer Availability.vbs (Site 1)

' Description: Uses the Win32_PingStatus class to verify that a computer is accessible over the network.

```
strComputer = "."
Set objWMIService = GetObject("winmgmts:"
& "(impersonationLevel=impersonate)!\\" & strComputer & "\root\cimv2")
Set colPingedComputers = objWMIService.ExecQuery
("Select * from Win32_PingStatus Where Address = '192.168.1.37'")

For Each objComputer in colPingedComputers
    If objComputer.StatusCode = 0 Then
        Wscript.Echo "Remote computer responded."
    Else
        Wscript.Echo "Remote computer did not respond."
    End If
Next
```
